COMMAND OVERVIEW

The Command overview chapter lists all GDS-1000E commands in functional order as well as alphabetical order. The command syntax section shows you the basic syntax rules you have to apply when using commands.

Command Syntax

Compatible standard

- USB CDC_ACM compatible
- SCPI, 1994 (partially compatible)

Command forms

Commands and queries have two different forms, long and short. The command syntax is written with the short form of the command in capitals and the remainder (long form) in lower case.

The commands can be written in capitals or lower-case, just so long as the short or long forms are complete. An incomplete command will not be recognized.

Below are examples of correctly written commands.

LONG :TIMEbase:SCALe? :TIMEBASE:SCALE?
:timebase:scale?

SHORT :TIM:SCAL?		:TIM:SCAL?	
Command format	:TIMEbase:SCALE <NR3>LF		
	1: command header		
	2: single space		
	3: parameter		
	4: message terminator		
Parameter	Type	Description	Example
	<Boolean>	boolean logic	0, 1
	<NR1>	Integers	0, 1, 2, 3
	<NR2>	floating point	0.1, 3.14, 8.5
	<NR3>	floating point with an exponent	4.5e-1, 8.25e+1
	<NRf>	any of NR1, 2, 3	1, 1.5, 4.5e-1
Message terminator	LF	line feed code	
Note	Commands are non-case sensitive.

:ACQuire<X>:MEMory? 

Description	Returns the data in acquisition memory for the selected channel as a header + raw data.	
Syntax	:ACQuire<X>:MEMory?	
Related Commands	:ACQuire:RECOrdlength :HEADer	
Parameter	<X>	Channel number (1 to 4)
Return parameter	<string> <waveform block data>	<p>Returns acquisition settings followed by raw waveform block data.</p> <p><string> Returns the acquisition settings for the selected channel.</p> <p>Format: parameter(1),setting(1);parameter(2),setting(2)...parameter(n),setting(n);Waveform Data;</p> <p><waveform block data> Header followed by the raw waveform data.</p>

Format:

Header: The header (in ASCII) encodes the number of bytes for the header followed by the number of data points in bytes for the raw data.

Raw Data:

Each two bytes (in hex) encodes the vertical data of a data point. The data is signed hex data (2's complement, -32768 ~ 32767).

Waveform Raw Data Example:

Header raw data.....

Hex:

23 34 32 30 30 30 00 1C 00 1B 00 1A 00
1A 00 1B

ASCII/Decimal:

#42000 28 27 26 26 27

The actual value of a data point can be calculated with the following formula:
(Decimal value of hex data/AD Factor) * vertical scale.

Note: AD Factor is fixed as 25. The vertical scale is returned with the

		acquisition settings that precede the raw data. For example if the raw data for a point is 001C (=28 decimal) then, $(28/25) \times 0.5 = 0.56V$
